removed.txt

Good Morning Bob,

Is there a web session with S2C2 scheduled?

Could you ask Bristol for

- 1) Shape files for the MiHpt borings
- 2) Lab Analytical for the sampled wells

I am preparing for LIF work tomorrow.

Thank you,

Kristen Hanson

Bob,

I've sent an email to S2C2 to see about getting those 4DIM files. Also, I forgot to mention that Jason offered to host another web session for anybody that would like to see what he's been working on, though he did say he'd be out most of the rest of the week, returning next week.

I agree with all of Jason and Matt's suggestions. I would like to see S2C2's visualization for the MIHPT work. We can wait for the final report until after the LIF work, but it would be good to see the 4-dims as soon as they are ready. That will help guide the LIF work.

Tom

Please see Matt's message below with some recommendations from S2C2 on LIF locations.

I do not mind waiting to include the LIF data into the S2C2 model. Please let me know what you think about it and I will pass your messages on to Matt.

Thank you

Subject: MiHPT and LIF data for Tower

PLEASE NOTE THE EPA AND CONTRACTORS ARE RECEIVING THIS EMAIL

Hi Bob,

I wanted to let you know that I had a web meeting with S2C2 (our MiHPT data visualization contractor) this morning and got to see how their model is coming together. In general I would say that it's impressive.

We talked about how the LDF Tribe has an LIF study planned for next week and considered whether S2C2 should hold off on finalizing their report incorporate the pending LIF data into the model. I thought that would probably be worth the wait but thought I better check with you and potentially Kristen.

In regards to suggestions for objectives for the LIF study, Jason (from S2C2) thought the probes would be best used in the source area (as I believe Kristen is planning) with a special emphasis on finding the bottom of the impacted zone. LIF will be most effective in the source area because it will not see dissolved phase contamination at all.

The other suggestion that Jason had was to perhaps drive LIF probes at the same locations as MiHPT locations 14 and 15. Both of those probes had some FID response at a shallower depth than expected (10-16 feet) that was not associated with significant PID response. In both borings there was relative high in HPT pressure in these intervals as well, and S2C2 is question whether they may be some sort of matrix effect. If LDF has the time available during their LIF study, it might be worth checking out these two spots. It would be even better if soil samples could be collected from these intervals.

Thank you,

--Matt
